CFX_List2Query - Introduction

CFX_List2Query is a high performance tag to convert a delimited list into a single column query. It does little more than what can be done in Cold Fusion natively however it does it quite a bit faster!

CFX_List2Query - Syntax

```
<CFX_List2Query  
NAME="queryname"  
COLUMN="columnname"  
LIST="list "  
DELIMITER="delimiter">
```

NAME

Required. Specify the name of the query you want to create.

COLUMN

Required. Specify name of the column you want in the query that will contain the data from the list.

LIST

Required. Specifies the list which will be turned into a query.

DELIMITER

Optional. Use this to optionally override the default delimiter (,).

Testing

CFX_List2Query has been tested using Cold Fusion 5 and CFMX 6.1 on Windows 2000 Advanced Server SP3 and Windows 2003 for Web-servers respectively. Both Apache 1.3/2.x, and IIS5 and 6 server installations along with the CFMX standalone server installations have been used for testing.
